

The graph displays monthly precipitation data over a five-year period. The y-axis represents precipitation in millimeters (mm), ranging from 0 to 400. The x-axis represents time, with labels for months and years from December 2019 to June 2025. The data shows a highly variable pattern with several peaks and troughs. Notable peaks occur in late 2022 (reaching approximately 400 mm) and late 2024 (reaching approximately 350 mm). Troughs, where precipitation drops to near 0 mm, are observed in late 2019, late 2022, and early 2025.
